

**Compute/calculate the limits of a sequence.**

**CLAN** (niza) - term

Opsti clan – a general term (of a sequence)

**D**

Dat the phase:

Dat je ... pomocu

The function  $f$  is given by

( *do not miss the definite article!* ).

Dobijati (rezultat) we have/we obtain

Dobija se

Trouugo N se dobija kada se

The N triangle is obtained by

Dovoljno

Dovoljno malo/veliko

Tada, ako je  $x$  dovoljno malo

You have to use the inversion in such case.

Thus, the correct translation: Then for  $x$  sufficiently small

(it is not correct to write: Then for a sufficiently small  $x$  or If  $x$  is sufficiently small)

**Odrediti** – determine

granicne vrednosti

Determine the limits of the following sequences

In Serbian assignments, you will find such expressions written with infinitive:  
**odrediti**.

## I

**Ispitati** – to check

**Izlaziti, slediti** – it follow

**Indukcija** – induction, matematicka indukcija, matematickom indukcijom se ustanovljava - If we apply induction to (4), we get (no articles in front of induction)

## K

Kako je (in dependent clauses) – Since

**KONVERGENCIJA** – convergence

## M

**MONOTONIJA** – monotonicity

**O**

**ODAVDE** - hence ( compare: odate, whence)

This is easily solved by using the imperative mood: determine (or compute, calculate – for izracunati)

**O**

Odredjeni integral – definite integral

Omoguciti – enable

Primedba – observation, remark

Pretpostavka - assumption,

pod pretpostavkom, da/under the assumption that

Primena

Example: primena Stolzove teoreme omogucava nam

The application of Stolz's theorem enables to

Pustajuci ovde – by letting herein

Neka je  $x$  proizvoljno izabrano – Let us arbitrarily fix

## P

Postojati –

There exists D such that (No comma required!)

Posmatrani niz:

The sequence under consideration,

The observed sequence

Pretpostaviti

Pretpostavimo – suppose that, assume that

Protivrecnost – contradiction

## R

Rasudjivanje – reasoning (better), or method

Istim rasudjivanjem

By the same method

Or: reasoning, The same reasoning applies to the case ..

Redom – respectively

Reci

Mozemo reci za niz da strogo raste

The sequence can be said to be strictly increasing

## **T**

Tacan – true: hold

In assignments that use expression such as:

Da li su jednakosti tacne? Do not translate as: Are the following equalities true?

But Do the following equalities hold? (also do not miss the expression: the following)

Teme: vertex

Trougao – triangle

## **Z**

Zakljuciti – moze se zakljuciti, it may be concluded (not: it can be concluded! )

Zavisnost –

U zavisnosti od – depending on
